Radioactive Device Licensing

## **Safety Alert**

Issue #:08-2017

#### Enform

Enform is the health and safety association for Canada's upstream oil and gas industry. We provide leading health and safety training, programs and services, touching the lives of hundreds of thousands of workers each year. We are dedicated to the continuous improvement of safety with a vision of eliminating workrelated incidents or injuries in the upstream oil and gas industry.

### An Industry Product

This document was developed by industry for industry. Working collaboratively, Enform works with the submitting organization representative in developing these documents to improve the industry's hazard awareness. Canada's leading oil and gas industry trade associations support the use of shared information to help companies of all sizes improve performance.

### Disclaimer

This document is intended to be flexible in application and provide guidance to users rather than act as a prescriptive solution. Recognizing that one solution is not appropriate for all users and situations, it presents accepted guidance that generally apply to all situations. While Enform believes that the information contained herein is reliable under the conditions and subject to the limitations set out, Enform does not guarantee its accuracy. The use of this document or any information contained will be at the user's sole risk, regardless of any fault or negligence of Enform and the submitting organization.

## Copyright/Right to Reproduce

Copyright for this document is held by Enform, 2017. All rights reserved. Enform encourages the copying, reproduction and distribution of this document to promote health and safety in the workplace, provided that Enform is acknowledged. However, no part of this publication may be copied, reproduced or distributed for profit or other commercial enterprise, nor may any part be incorporated into any other publication, without written permission of Enform.

## **Description of Incident:**

A Canadian purchaser and a United States supplier were both unaware of the Canadian radioactive licensing requirements for certain ignition exciters found in gas turbines. Some of these ignition exciters contain radioactive materials such as Krypton-85. Many of these exciters have a radioactivity level that is exempt in the United States, because it is below the threshold of 1,110 kilo becquerels (30 micro curies). In Canada however, the threshold for Krypton-85 is lower at 10 kilo becquerels.

**Radiation Trefoil** 

Some ignition exciters include a sealed capsule of Krypton-85 in the form of spark gaps, contained within an encased, hermetically sealed metal box. Other radioactive elements may be present depending on the manufacturer and age of the device (i.e. Cs-137). Radiation readings from 5 cm away and outside the sealed metal container, indicate a dose rate from the ignition exciter that is similar to background, or naturally occurring, radiation levels.

There is a remote possibility of increased exposure if the sealed metal box is opened or the ignition exciter breaks and the gas is directly inhaled or ingested. The Canadian Nuclear Substances and Radiation Devices Regulations includes exemptions for low level radioactive devices, however, these ignition exciters are not exempt and therefore require a low-risk license.

# What Caused It?

Supplier and purchasing company were unaware of the regulatory licensing differences between Canada and the United States.

# **Contributing Factors**

The radioactive component was being sold as part of an overall turbine purchase.

By industry, for industry

# **Corrective/Preventative Actions:**

- Conduct an inventory of all ignition exciters with radioactive elements that exceed Canadian Nuclear Substances and Radiation Devices Regulations <u>thresholds</u>
- Apply for and obtain a licence from the Canadian Nuclear Safety Commission for the use and possession of the radioactive devices
- Do not perform maintenance on ignition exciters that have a radioactive element. This equipment follows a replacement maintenance strategy (i.e. exciter units may be replaced intact if necessary) and this practice should continue to be followed.
- Do not break open the metal casing on ignition exciters that contain a radioactive element
- Do not dispose of ignition exciters containing a radioactive element as regular waste
- Minimize contact with ignition exciters that contain a radioactive element

For additional information on how to obtain a license, please contact the Nuclear Substances and Radiation Devices Licensing Division of the Canadian Nuclear Safety Commission at <u>cnsc.licence-permis.ccsn@canada.ca</u> or 1-888-229-2672.
